ON THE THEORY OF ENERGY BANDS FOR TRANSITION METALS OF THE FIRST PERIOD. [1961] 7p. 23 refs.
Order from SLA $1.10 61-18691

Trans. of Helvetica Physica Acta (Switzerland) 1960, v. 33, no. 9, p. 954-959.

DESCRIPTORS: *Metals, *Transition elements, Energy, Specific heat, Electrons, Theory.

Recent measurements of the specific electronic heat Y and the common Hall constant R_o as a function of Z seems to challenge the general band model for the transition metals and, particularly, the approximation of the rigid band. Perhaps better approximations of the band theory will re-establish agreement with experiment. It seems desirable to extend the measurements

The mass spectra of nine saturated hydrocarbons with 5, 6 and 7 C atoms are studied in the temperature range between 100 and 900°C. For measurement the walls of the ionization zone of the ion source in which the gas to be studied is present under a pressure of ca. 10^{-3} Torr. can be heated to ca. 1000°C. Gold serves as the wall material. For one of the hydrocarbons (2, 2-dimethylbutane) an additional measurement was made of how the spectrum changes when the walls of the ionization zone are clad with a cracking catalyst. The catalyzed methane formation could be
